A review on early forest fire detection systems using optical remote sensing	Panagiotis Barmpoutis Konsmas Dimitropoulas Nikos Grammalidis(2020)	To review a review of early forest fire detection systems	These are affected by weather conditions and in many cases,their flight time is limited	Early fire detection multispectral imaging systems,terrestrial,aerial,satellit e, Artificial intelligence
Natural hazards wildfires	Prof.David(E.Alexande r)	Forest and rangeland fires are a source of important eldogical and economic damage. A wildfire burns out of control and threatens people buildings or resources	1.Lightning strikes 2.Human negligence and vandalism (greatest at the urban rural interface)	Do not burn any materials that are combustible or unusual in nature
The influence of climate change on forest fires in Yunnan province, Southwest china detected by GRACE satellites	Lilu cui Chaolong yao Zhengbo zou(2022)	The analyze the influence of climate change on forest tines in Yunnan	Climate change affects the occurrence of forest fines by changing the dryness ob combustibles through temperature, Precipitation, Evapotranspiratio n etc.	The results show that GRACE satellites can detect the influence of climate change on forest fire Yunnan province
Emerging method for early detection of forest fires using	G.V.Hristor Diyana kyuchukova Jordan Raychev(2018)	There are primary aimed at the early detection of the fires	Cause devasting damage to both nature and humans,air pollution,every fire huge	The modern IR cameras, unmanned aerial vehicles in fight against the forest fires as replacement of the piloted aircrafts
